 Buhlmann and Wyner (1999): Probability and Statistics point of view

Definition

(Buhlmann & Wyner, 1999) Let $(X_t)_{t\in\mathbb{Z}}$ be a stationary process with values $X_t \in \mathcal{X}$, $|\mathcal{X}| < \infty$. Denote by $c : \mathcal{X}^{\infty} \to \mathcal{X}^{\infty}$ a (projection) function which maps

$$c: x_{-\infty}^{0} \to x_{-\ell+1}^{0}, \text{ where } \ell \text{ is defined by} \\ \ell = \min\{k: P(X_{1} = x_{1} | X_{-\infty}^{0} = x_{-\infty}^{0}) = P(X_{1} = x_{1} | X_{-k+1}^{0} = X_{-k+1}^{0}) \\ \text{for all } x_{1} \in \mathcal{X}\}$$

Then, $c(\cdot)$ is called the context function for any $t \in \mathbb{Z}$, and $c(x_{-\infty}^{t-1})$ is called the context for x_t .

Theorem

Assume that the beta-context tree τ has finite order k and the contexts $u \in \tau$ are correctly identified, that is, $\hat{\tau} = \tau$, and that its associated parameter tree $\hat{\tau}_{\theta}$ is pruned sequentially backwards. Then, under conditions C1 and C2, the estimated associated parameter tree is consistent in the sense that

$$\lim_{n\to\infty} P[\hat{\theta}^u = \theta^u, \forall u \in \tau] = 1.$$

Theorem

Assume that the beta-context tree τ has finite order k and the contexts $u \in \tau$ are correctly identified, that is, $\hat{\tau} = \tau$, and that its associated parameter tree $\hat{\tau}_{\theta}$ is pruned sequentially backwards. Then, under conditions C1 and C2, the estimated associated parameter tree is consistent in the sense that

$$\lim_{h\to\infty} P[\hat{\theta}^u = \theta^u, \forall u \in \tau] = 1.$$

The proof of this theorem is based on showing that the probability of over-fitting and under-fitting tend to 0.

ヘロン ヘアン ヘビン ヘビン

Theorem

Assume that the beta-context tree τ has finite order k and the contexts $u \in \tau$ are estimated using the beta-context algorithm. Then, under conditions C1 and C2, the estimated context tree is consistent in the sense that

$$\lim_{\tau\to\infty} P[\hat{\tau}=\tau]=1.$$
